

Sonographic Evaluation of the Pediatric Hip

**Hamad Ghazle, Ed.D, APS, RDMS
Professor & Director**

**Advanced Practice Sonographer
Diagnostic Medical Sonography Program
Rochester Institute of Technology
University of Rochester Medical Center**

Developmental Dysplasia of the Hip

- Abnormal relationship of femoral head to the acetabulum
- Formerly known as congenital hip dislocation
- Believed to be developmental

Most
dislocations
are evident
at births

Some
develop
later in
infancy

For this reason,
it is now called
developmental
dysplasia of the
hip

Developmental Dysplasia of the Hip (DDH)

- General term encompassing a wide range of disorders of the hip
 - Dislocation
 - Subluxation
 - Instability/inadequate acetabular development
 - Reducible subluxed or dislocated hips
 - Irreducible hips and dislocations resulting from teratologic etiologies

Normal

Low Dislocation

High Dislocation

Subluxation

Terminology Encountered

- Hip dysplasia
- Developmental dysplasia of hip (DDH)
- Developmental dislocation of hip (DDH)
- Hip dislocation
- Congenital dislocation of hip (CDH)
- Acetabular dysplasia

The severity and time of occurrence determines the name

DDH Incidence

- Incidence 5-7 per 1000 cases
 - Can be higher if taken into account the minority of adults who undergo hip replacement for osteoarthritis have a background of previously undetected and asymptomatic hip dysplasia
 - 1.5-20 per 1000
- Usually unilateral (80% of cases) and on the left
- Different than immature hips which resolve within 2-8 weeks
- Higher in Caucasian/Native-American populations
- Females (8x higher)

Causes/Risk Factors

Multifactorial

- Previous family history
- Firstborn Children
- Oligohydramnios
- Breech position
- Abnormal laxity of ligaments and hip capsule
- Teratologic

Causes/Risk Factors

If a child has DDH, the risk of another child having it is 6% (1 in 17)

If a parent has DDH, the risk of a child having it is 12% (1 in 8)

If a parent and a child have DDH, the risk of a subsequent child having DDH is 36% (1 in 3)

Lack of space & restriction of movement in utero

Extreme hip flexion with knee extension

Due to hormones secreted by mothers to lax the ligaments (stretch easier) to allow easier vaginal delivery

- Girls have more laxity than boys

Occur during fetal development and associated with other abnormalities

- Arthrogryposis, spina bifida, foot deformities, torticollis

Fetal Positions

Complete
breech

Incomplete
breech

Frank
breech

Signs & Symptoms

Asymmetrical gluteal creases

Asymmetrical thigh creases

Asymmetrical legs

Hip clicks/pops (different than snapping)

- Not all babies

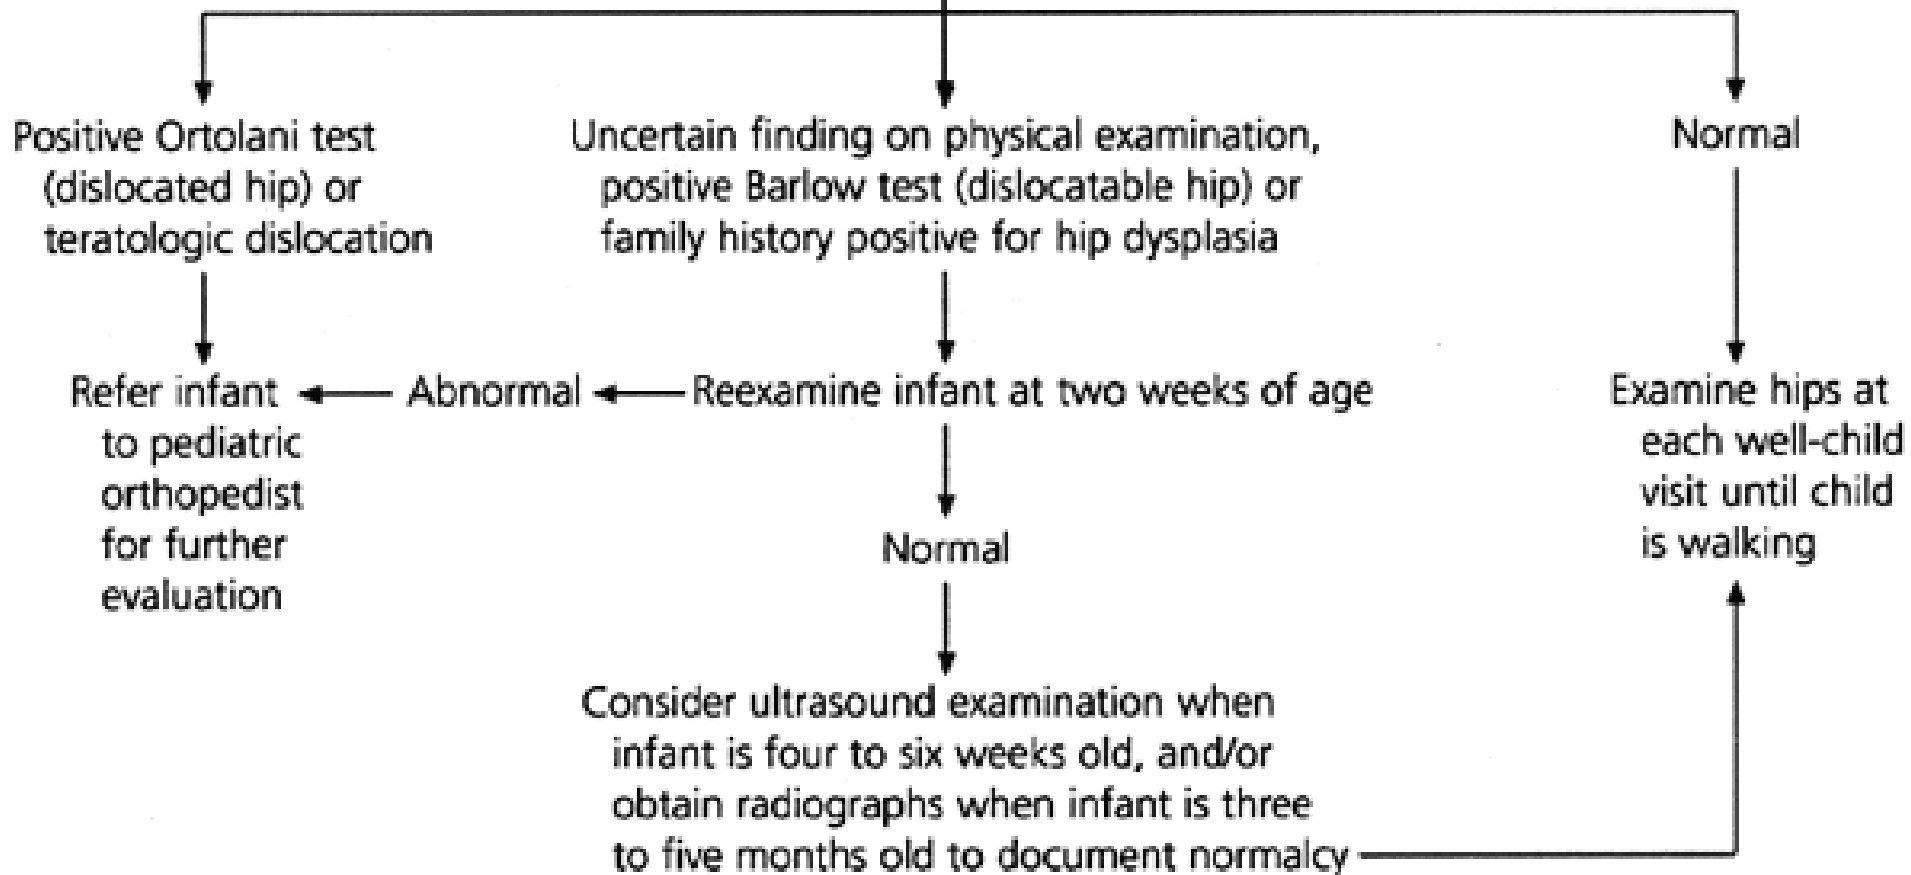

Asymmetric Gluteal, Thigh and Labial Folds

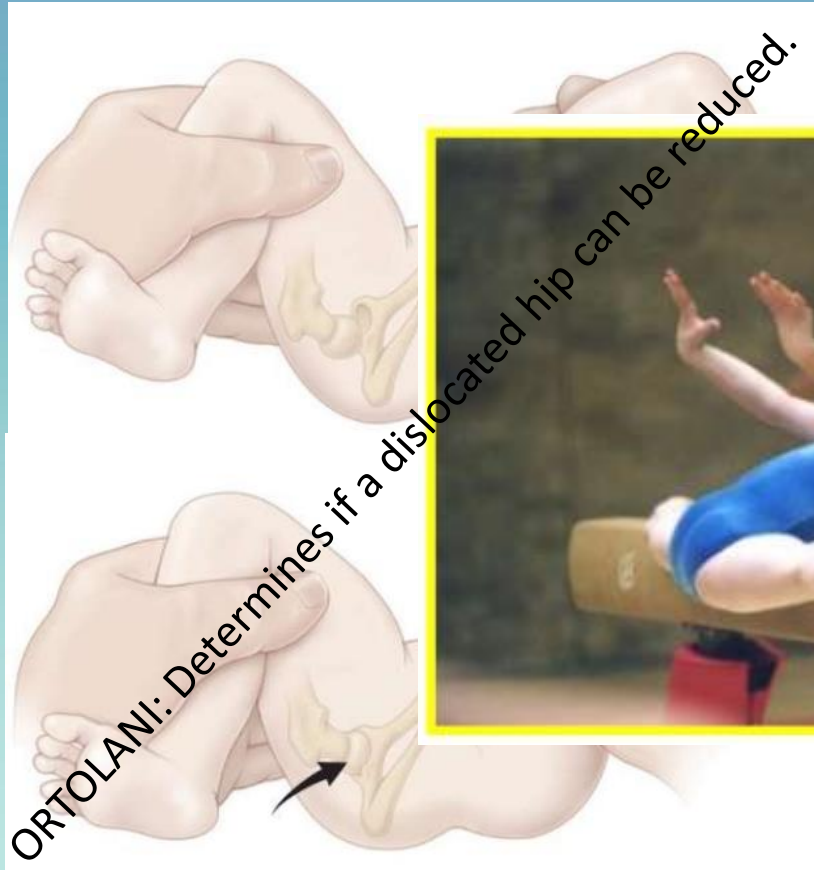

Galeazzi Test/knee height difference

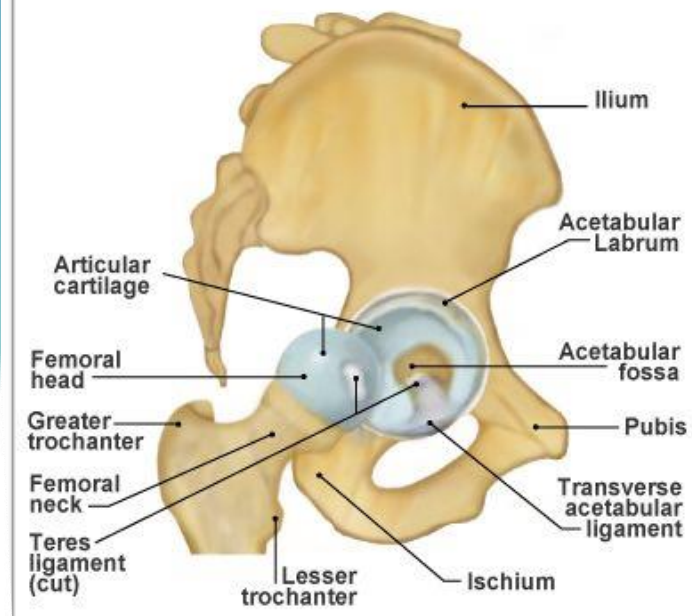

Perform physical examination using Ortolani and Barlow maneuvers

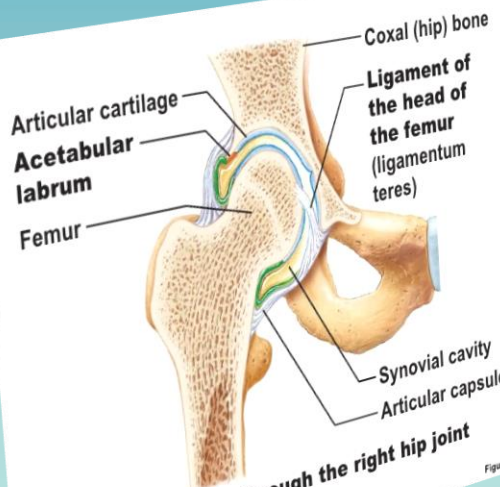

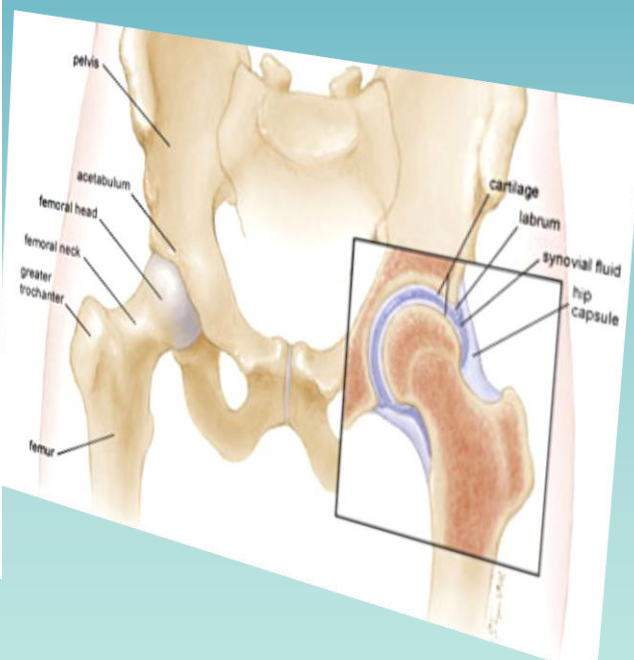

The Ortolani and Barlow maneuvers have been the standard techniques for detecting hip instability in newborns

Sonographic Methods

Static

Proposed by Graf
Coronal images: to assess anatomy and morphology

Dynamic

- Real-time assessment of hip in a **transverse plane**
- Proposed by Harcke

Graf Sonographic Anatomic Classification

GRAF SONOGRAPHIC HIP TYPE		BONY ROOF	OSSIFIC RIM	CARTILAGE ROOF	ALPHA ANGLE
Ia	Mature	Good	Sharp	Long and narrow, extends far over femoral head	>60°
Ib	Mature	Good	Usually blunt	Short and broad but covers femoral head	>60°
IIa	Physiological delay in ossification <3 months	Deficient	Rounded	Covers femoral head	50–59°
IIb	Physiological delay in ossification >3 months	Deficient	Rounded	Covers femoral head	50–59°
IIc		Deficient	Rounded/flat	Covers femoral head	43–49°
D	On point of dislocation	Severely deficient	Rounded/flat	Compressed	43–49°
IIIa	Dislocated	Poor	Flat	Displaced upward and echo-poor	<43°
IIIb	Dislocated	Poor	Flat	Displaced upward and more reflective than femoral head	<43°
IV	Dislocated	Poor	Flat	Interposed	<43°

Static Evaluation of Hip

– Measurements

- Alpha angle: formed by the acetabular roof to the vertical cortex of the ilium
 - > 60 is considered normal
 - Between 43-60 mild dysplasia
 - < 43 severe dysplasia

– Beta angle: formed by the vertical cortex of the ilium and the triangular labral fibrocartilage (echogenic triangle)

- Normally < 77 degrees

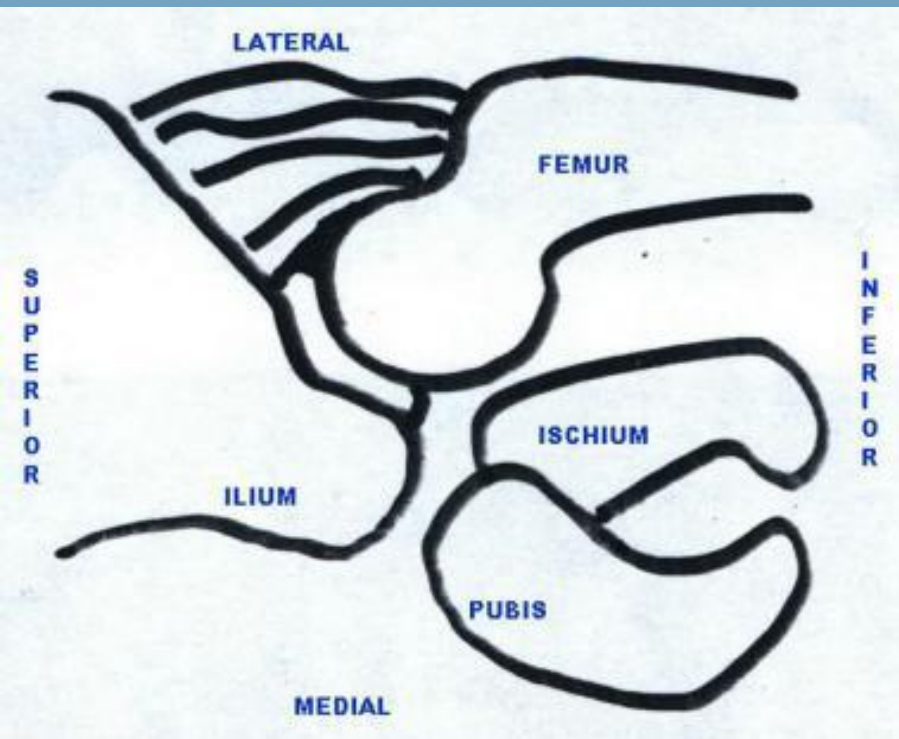

– Bony coverage

- The percentage of the femoral epiphysis covered by the acetabular roof. A value of $>50\%$ is considered normal

Sonographic Techniques

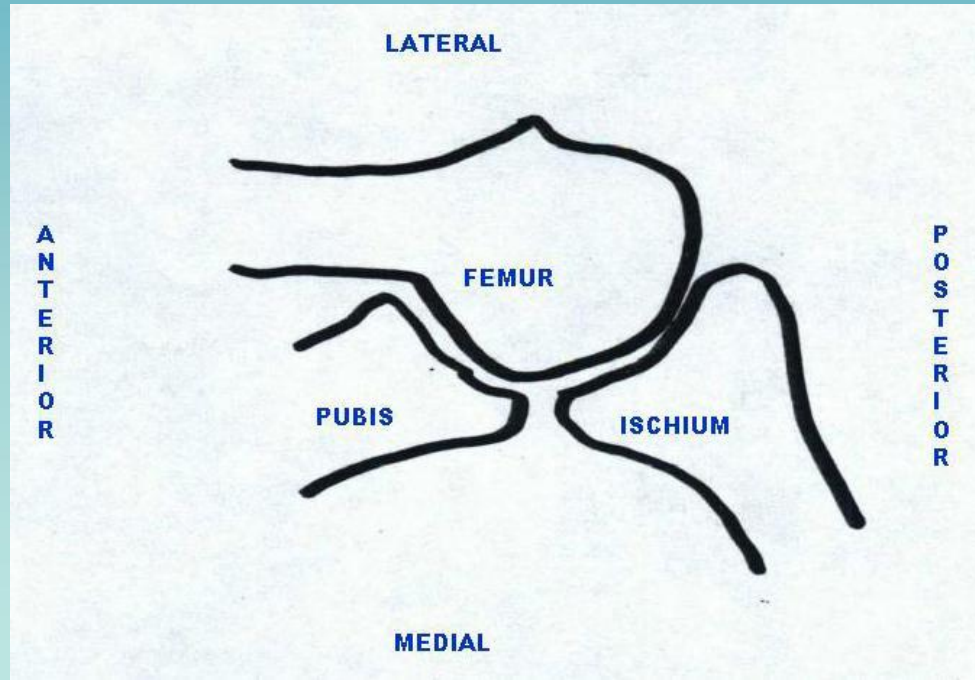

- High-frequency Linear-array transducer (dependent on baby's body habitus)
 - 5-9 MHz
- Place baby in a supine position
 - Others recommend RPO or LPO
 - Place a folded towel or wedge to support baby
 - An oblique position enables the examiner to maintain the planes of interest through movements of adduction and abduction.
 - Research also suggests examining the infant with its feet toward the examiner. (if possible, I know it is hard)
- When examining the right hip, hold the transducer in the left hand while the right hand guides the positions and movements.
- When examining the left hip, the right hand holds the transducer while the left hand guides the positions.
- Place transducer on lateral or posterolateral aspect of hip joint

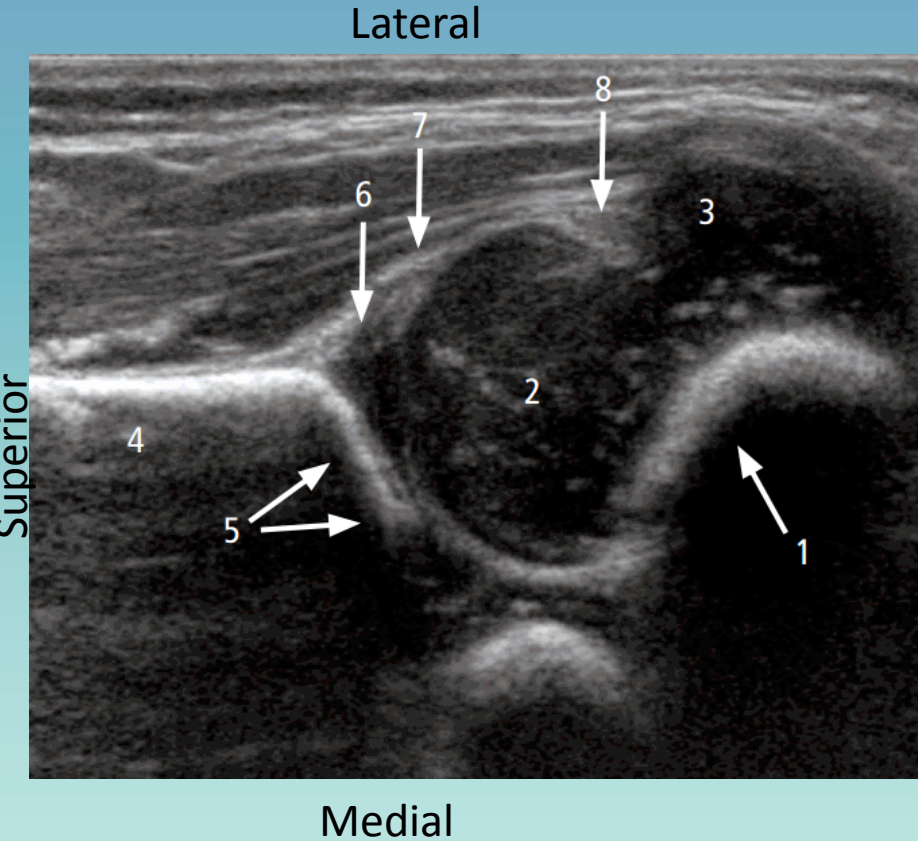

Coronal

Transverse

Sonographic Appearance

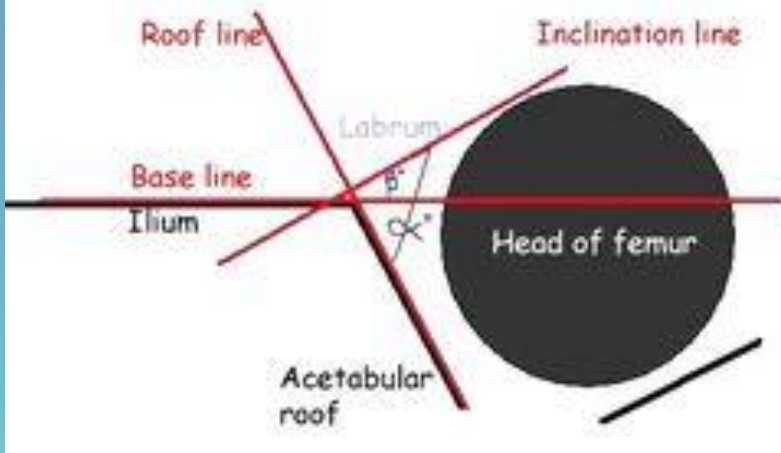

Egg-in-a-spoon in a coronal plane

Inferior

1, chondro-osseous junction between the bony part and the cartilaginous part of the femoral neck; 2, cartilaginous part of the femoral head (hyaline cartilage); 3, greater trochanter; 4, iliac bone; 5, lower limb of the ilium and bony acetabular roof; 6, cartilaginous acetabular roof; 7, acetabular labrum; 8, synovial fold.

Angles

Bony Coverage

Ultrasonography of a 2-month-old girl shows that the α angle is abnormal, measuring 56°

Normal Transverse showing cup-like appearance formed by metaphysis & ischium

F= femoral head

M=femoral metaphysis

I= ischium

T= triradiate cartilage

Arrow= cartilaginous labrum

Abnormal hip: Transverse view of hip with stress showing subluxation of femoral head from its normal position and disruption of cup-like configuration. This hip was reducible.

Treatment

- Pavlik Harness
 - usually for younger patients (less than six months of age)

I can't Look Anymore.....

An aerial photograph of a large campus, likely the Rochester Institute of Technology, featuring a winding river on the left, extensive greenery, and a complex network of roads and buildings. The text "Thank YOU so much for your kind attention" is overlaid in the center in a bold, yellow font.

Thank YOU so much for your kind attention
